

Tools and materials

At this webpage, we present various tools and other materials developed for use in diagnostic evaluation and treatment of dementia.

A brief case-finding instrument for dementia (BASIC)

The *Brief Assessment of Impaired Cognition* (BASIC) is a brief and accurate case-finding instrument for dementia and cognitive impairment. Previous research indicates that combining cognitive tests with informant and self-report may improve accuracy in dementia case-finding. BASIC integrates these three sources of information.

A brief questionnaire for dementia (BASIC-Q)

The *Brief Assessment of Impaired Cognition Questionnaire* (BASIC-Q) is a brief and accurate questionnaire for dementia and cognitive impairment. BASIC-Q integrates self-report, questions regarding orientation and informant-report.
